MAYJUUN

The Expert in FHIR®-based Applications in Healthcare

AT A GLANCE

Founded by clinicians, MayJuun develops customized and effective healthcare apps so more time can be spent focused on patients and their care.

MISSION

Where User Interfaces Match Your Workflow

We believe that lowering the barriers to entry – both technical and monetary – will allow for innovation, broader applications, and the ability to use technology to improve people's lives.

Our solutions are unique in using both the FHIR® interoperability standard and the Flutter Toolkit, achieving CMS guidelines. These guidelines are encouraging stakeholders to move towards smarter processing of data requests, with the objective of achieving real-time, more accurate, and faster responses.

As practicing clinicians, we understand the need for accurate and actionable data to be balanced with workflows, minimizing unnecessary steps and extra clicks.

Optimize workflows for patients & providers

Digitize forms & surveys; Decrease data entry burden

Data stored safely & securely (HIPAA)

SOLUTIONS

Cuestionario

Cuestionario is a white-label application with customized data capture and review of FHIR® compliant assessments. It digitizes any form, questionnaire, survey, or screening tool. Cuestionario can be used across numerous devices (cross-platform) and has the ability to generate surveys in any language.

Recetario

Recetario is the companion tool to Cuestionario. It captures survey responses then analyzes and transforms it into actionable insights. It has extensive analytic capabilities that allow you to see scores/sub-scores for each survey, as well as population-level statistics based on survey completion and timing.

EMS Protocols

EMS Protocols is a cross-platform app designed to quickly view, interact, and search through PDFs. This app allows EMTs to access the guidelines and protocols necessary for on-shift patient care, even in remote settings with limited internet connectivity.
